

Leaf health check using AI generative

Team ID : 69a7f7effa5736d932f6b8fb

Team Leader : Pratap . S

Team Member 1 : Vinodhini . G

Team Member 2 : Anitha.k

Introduction:

The introduction should establish the problem space and the paradigm shift brought by AI. Traditional plant health monitoring relies on manual scouting or laboratory testing, which is often time-consuming, costly, and reactive—detecting deficiencies only after visible damage occurs .

You should introduce AI as a solution that shifts this paradigm from reactive to predictive and real-time. Modern computer vision and spectroscopy, powered by machine learning, allow for non-destructive, instantaneous analysis of leaf biochemistry and pathology. Recent advances have moved beyond simple species identification to nuanced health assessments, including nutrient quantification (Nitrogen, Phosphorus, Potassium) and early stress detection before symptoms are visible to the human eye .

Abstraction:

The abstraction (or summary) of your project should concisely state the methodology and the high-level results. Based on current literature, a typical abstract for this topic reads as follows:

“This paper presents a novel framework for automated leaf health assessment utilizing advanced deep learning and spectroscopy techniques to ensure agricultural sustainability. Traditional methods of plant monitoring are inadequate for large-scale, real-time precision agriculture. We propose a hybrid model integrating Convolutional Neural Networks (CNNs) for image-based disease classification and spectral analysis for biochemical trait prediction. By leveraging datasets combining visual imagery and hyperspectral leaf reflectance (400–2500nm), the system detects nutrient deficiencies (e.g., Nitrogen, Potassium) and classifies pathological conditions with high accuracy. The integration of Explainable AI (XAI) and Large Language Models (LLMs) further provides farmers with interpretable insights and remedial recommendations, transforming raw data into actionable agricultural intelligence .”

Skills Required:

To execute a project of this nature, you need a blend of domain knowledge and technical expertise. The specific skills are:

- **Deep Learning Frameworks:** Proficiency in TensorFlow or PyTorch for model development and training .
- **Computer Vision (CNNs):** Experience with architectures like MobileNetV3, EfficientNet, GoogleNet (Inception), and Vision Transformers (ViT) for image classification and feature extraction .
- **Data Handling & Preprocessing:** Ability to handle large datasets (e.g., PlantVillage) and perform image augmentation. For advanced projects, knowledge of hyperspectral data processing and feature extraction using techniques like GLCM (Gray Level Co-occurrence Matrix) for texture analysis is crucial .
- **Model Optimization:** Understanding of ensemble methods (stacking ensembles) and novel architectures like Mamba (State Space Models) to balance high accuracy with computational efficiency for IoT deployment .
- **Explainable AI (XAI):** Familiarity with tools to make model decisions transparent (crucial for user trust in agriculture) .

Implementation:

Implementation can be broken down into distinct stages, moving from data collection to deployment.

Stage 1: Data Acquisition and Dataset Preparation

- **Source Data:** Gather a comprehensive dataset. This can be public datasets like PlantVillage (for diseases) or custom spectral libraries. For the UC Davis “Leaf Monitor” project, researchers spent five years collecting thousands of leaf samples and pairing spectral scans with wet chemistry analysis to validate nutrient levels .
- **Preprocessing:** Clean the data, resize images, and perform normalization. For spectral data, this involves calibrating the reflectance values from the spectrometer.

Stage 2: Model Development and Training

- **Algorithm Selection:** Choose the model architecture based on the target output.
 - **For Disease Classification:** Implement a CNN (like the 98.91% accurate model cited in research) or a Vision Transformer to categorize leaves as healthy or diseased (e.g., Early Blight, Leaf Mold) .

- For Nutrient Analysis: Develop a regression model or specific classifier using spectral data to predict exact nutrient levels (N, P, K) .

- For Advanced Systems: Implement a stacking ensemble. For example, combining MobileNetV3, GoogleNet, and ConvNeXtSmall with a CatBoost meta-learner to improve prediction robustness .

- Training: Train the model on the prepared dataset. Use transfer learning where possible (using pre-trained ImageNet weights) to reduce training time and improve accuracy .

Stage 3: System Integration and Intelligence Layer

- LLM Integration: Connect the classification output to an LLM. When the model detects a specific disease (e.g., “Leaf Spot”), that label is passed to the LLM with a prompt to generate a contextualized treatment plan (e.g., recommended fungicides or cultural practices) .

- Explainability: Integrate XAI techniques (like heatmaps) to show where on the leaf the disease or deficiency is located, making the AI’s decision transparent to the user .

Leaf Health Check

Project Description

Monitoring plant health is a crucial activity in agriculture, horticulture, and home gardening. Traditional methods of detecting plant diseases require manual inspection, expert knowledge, and significant time investment. In many cases, early symptoms such as discoloration, spots, or texture changes on leaves are overlooked, leading to severe plant damage and reduced crop productivity. Leaf Health Check addresses this challenge by providing an AI-powered plant leaf analysis platform that delivers fast, accurate, and intelligent diagnosis.

Leaf Health Check is a smart application developed using the Streamlit framework that allows users to upload an image of a plant leaf and receive an instant health assessment. The system applies advanced image processing and deep learning techniques to examine visual symptoms such as yellowing, browning, and dark patches. These symptoms are analyzed through a discoloration detection logic that calculates the affected area and identifies possible signs of disease or nutrient deficiency.

The platform also includes a plant species identification module that compares the uploaded leaf image with a structured plant database. Once the plant type is recognized, the system performs disease prediction and evaluates the severity of the condition. Based on the percentage of damage and detected patterns, the leaf is classified into categories such as Healthy, Mild, Moderate, Severe, or Dying.

To make the system practical and user-friendly, Leaf Health Check generates a clear diagnosis along with three personalized rescue tips. These recommendations guide users in taking corrective actions such as adjusting watering schedules, applying fertilizers, improving sunlight exposure, or using suitable treatments.

By integrating artificial intelligence with an interactive web interface, the project transforms complex plant health monitoring into a simple, accessible, and real-time solution. The system is designed to assist farmers, students, researchers, and gardening enthusiasts in maintaining healthy plants without requiring expert-level knowledge. Leaf Health Check contributes to smart agriculture and sustainable plant care by enabling early detection and timely intervention.

Use Case Scenarios

Scenario 1: Leaf Image Upload and Health Analysis

Users upload a plant leaf image through the Streamlit interface. The system preprocesses the image by enhancing brightness, resizing it, and removing noise for accurate analysis. The AI model then detects discoloration patterns and predicts whether the leaf is healthy or affected by a disease. The result is displayed along with the severity level and confidence score.

Scenario 2: Plant Species Identification and Disease Detection

The system matches the uploaded leaf image with a plant species database. After identifying the plant type, it analyzes common diseases associated with that species and predicts the most probable condition. This ensures that the diagnosis is plant-specific and more accurate.

Scenario 3: Severity Grading and Rescue Recommendations

Based on the percentage of damaged area and the type of discoloration detected, the system assigns a severity level ranging from Healthy to Dying. It then generates three intelligent rescue tips that help users take immediate action to improve plant health and prevent further damage.

Architecture Overview

Leaf Health Check is an intelligent AI-powered plant disease detection system designed to analyze plant leaf images and provide accurate health diagnosis with actionable rescue recommendations. The application is built using the Streamlit framework and integrates a deep learning-based computer vision model to detect leaf discoloration, identify plant species, and determine disease severity.

The system processes uploaded leaf images, performs color analysis and species recognition, and delivers a structured diagnosis report including severity grading and personalized rescue tips.

Core Technologies

- Streamlit: Web application framework for building interactive AI-based user interfaces
- Python 3.8+: Backend processing and AI model integration
- TensorFlow / PyTorch: Deep learning framework for plant disease classification
- OpenCV: Image preprocessing and discoloration detection
- NumPy & Pandas: Data processing and analysis
- SQLite / PostgreSQL: Plant species and disease database management
- Matplotlib / PIL: Image visualization and processing

Component-Wise Architectures for Plant Leaf Disease Analysis

Component-Wise Architectures

Component	Description
Frontend UI (Streamlit)	Interactive web interface allowing users to upload plant leaf images. Displays AI-generated diagnosis, severity grading, and rescue tips.
Image Processing Module	Performs image resizing, normalization, RGB conversion, and discoloration detection (brown/yellow analysis).
AI Model Layer	CNN-based deep learning model that identifies plant species and predicts leaf disease with confidence score.

Severity Grading Engine	Calculates percentage of affected area and classifies health status (Healthy, Mild, Moderate, Severe, Dying).
Species Database Lookup	Matches identified plant species with stored database containing plant details, common diseases, and treatment guidelines.
Recommendation Engine	Generates three personalized rescue tips based on disease type and severity level.
Export Module (Optional)	Generates downloadable health report in PDF format.

System Workflow

1. User uploads leaf image through Streamlit interface
2. Image preprocessing (resize, normalize, noise reduction)
3. Discoloration detection (yellow/brown pixel percentage analysis)
4. AI model predicts:
 - o Plant species
 - o Disease class
 - o Confidence score
5. Severity grading is calculated
6. Rescue tips are retrieved from database
7. Final diagnosis report is displayed

Severity Grading Logic

- 0–10% Discoloration Healthy
- 11–30% Mild
- 31–60% Moderate
- 61–80% Severe
- 81–100% Dying

Severity is calculated based on:

- Percentage of yellow/brown regions
- Disease probability score
- Leaf texture damage

Output Format

Diagnosis Report

Plant Name: <Identified Plant>

Disease: <Predicted Disease>

Confidence Score: <Model Accuracy %>

Severity Level: <Health Grade>

Rescue Tips:

1. <Tip 1>
2. <Tip 2>
3. <Tip 3>

Deployment Architecture (Streamlit Based)

User Streamlit UI Image Processing AI Model Severity Engine Recommendation Engine
Output Display

The application can be deployed on:

- Streamlit Cloud
- AWS / Azure
- Local Server

Pre-requisites

1. Python 3.8 or above
2. Streamlit Framework
3. TensorFlow / PyTorch
4. OpenCV
5. Required Libraries (requirements.txt)

Example installation:

```
pip install -r requirements.txt
```

Run the application:

```
streamlit run app.py
```

Project Workflow

1. AI Model Setup & Initialization

Activity 1.1: Setup Deep Learning Environment

- Install Python and required AI libraries
- Configure TensorFlow / PyTorch environment
- Download plant leaf disease dataset
- Verify GPU/CPU compatibility for model training

Activity 1.2: Configure Environment and Dependencies

- Create virtual environment
- Install required packages using requirements.txt
- Configure model loading paths
- Setup image preprocessing configurations

Activity 1.3: Prepare Detection Logic

- Design discoloration detection algorithm
- Define yellow and brown color thresholds
- Prepare plant species classification labels
- Test preprocessing with sample leaf images

2. Core Functionality Development

Activity 2.1: Design Streamlit Application Structure

- Create main Streamlit interface (app.py)
- Build modular folder structure
- Implement navigation and layout components
- Configure session state handling
-

Activity 2.2: Implement Image Upload Module

- Upload JPG/PNG leaf images
- Validate image size and format
- Display preview of uploaded image
- Add loading indicator during analysis

Activity 2.3: Develop AI Prediction Pipeline

- Perform image preprocessing
- Run species identification model
- Detect disease class
- Calculate prediction confidence score

3. Backend Processing Implementation

Activity 3.1: Image Processing Module

- Resize and normalize images
- Convert images to RGB format
- Remove noise using filtering
- Extract discoloration regions using OpenCV

Activity 3.2: Severity Grading Engine

- Calculate percentage of affected pixels

- Apply grading logic:
 - Healthy
 - Mild
 - Moderate
 - Severe
 - Dying
- Combine discoloration + AI prediction results

Activity 3.3: Species Database Integration

- Create plant species database
- Map detected species with diseases
- Store treatment and care information
- Retrieve matching plant details

Activity 3.4: Recommendation Engine

- Generate rescue tips based on disease
- Adjust tips according to severity level
- Ensure minimum three actionable suggestions

4. UI Development (Streamlit)

Activity 4.1: Build Interactive Interface

- Application title and description
- Image upload widget
- Analyze button
- Progress spinner during processing

Activity 4.2: Implement Result Display

- Show detected plant species
- Display disease diagnosis
- Show severity badge
- Display confidence percentage
- Present rescue tips clearly

Activity 4.3: Add Export Functionality (Optional)

- Generate downloadable diagnosis report
- PDF export option
- File naming and download handling

5. Testing & Optimization

Activity 5.1: Functional Testing

- Test with multiple plant species images

- Validate discoloration detection
- Verify severity grading accuracy
- Check UI responsiveness

Activity 5.2: Model Evaluation

- Measure prediction accuracy
- Validate classification confidence
- Reduce false predictions
- Improve preprocessing quality

Activity 5.3: Performance Optimization

- Optimize image processing speed
- Reduce model loading time
- Improve Streamlit responsiveness
- Handle invalid or low-quality inputs

Activity 5.4: Deployment Readiness

- Prepare requirements.txt
- Configure Streamlit Cloud deployment
- Test application in production environment
- Ensure cross-platform compatibility

MILESTONE 1: Gemini AI Initialization

MILESTONE 1: AI Model Initialization

In this foundational stage, the objective is to establish and configure the core AI infrastructure required for the Leaf Health Check system. The platform utilizes a deep learning-based computer

vision model to analyze plant leaf images, detect discoloration patterns, identify plant species, and generate health diagnosis with rescue recommendations.

Activity 1.1: Setup Development Environment and AI Model

1. Install Required Software

- Install Python (version 3.8 or above)
- Install required IDE (VS Code / PyCharm)
- Setup virtual environment for project isolation

2. Install Required Libraries

```
pip install streamlit opencv-python tensorflow numpy pandas pillow python-dotenv
```

3. Prepare AI Model

- Download plant leaf disease dataset
- Configure trained CNN model (TensorFlow/PyTorch)
- Store trained model file inside /model directory
- Verify model loading functionality

Activity 1.2: Configure Environment and Test Setup

1. Create .env File

```
MODEL_PATH=model/leaf_model.h5
SECRET_KEY=leaf_health_secret
```

2. Load Environment Variables

Example configuration code:

```
import os
from dotenv import load_dotenv

load_dotenv()

MODEL_PATH = os.getenv("MODEL_PATH")
```

3. Test Model Loading

```
from tensorflow.keras.models import load_model

model = load_model(MODEL_PATH)
print("Model loaded successfully")
```

Expected Result:

- Model loads without errors
- Ready for prediction testing

Activity 1.3: Validate Image Processing and Prediction

Test Image Preprocessing

```
import cv2

image = cv2.imread("sample_leaf.jpg")
image = cv2.resize(image, (224,224))
print("Image preprocessing successful")
```

Test Disease Prediction

```
prediction = model.predict(image.reshape(1,224,224,3))
print("Prediction Generated")
```

Expected Output:

- Model predicts plant disease class
- Confidence score generated successfully

MILESTONE 2: Core Functionalities Development

This milestone focuses on building the core application using the Streamlit framework integrated with the Google Gemini API. The system accepts plant leaf images, processes visual information, analyzes discoloration patterns, and generates an AI-based diagnosis with severity grading and rescue recommendations.

File Explorer Structure

Activity 2.1: Streamlit Initialization and Import Libraries

Import Required Libraries

```
import streamlit as st
import google.generativeai as genai
import os
import cv2
import numpy as np
from dotenv import load_dotenv
from PIL import Image
```

Initialize Environment and Gemini API

```
load_dotenv()

genai.configure(api_key=os.getenv("GEMINI_API_KEY"))

model = genai.GenerativeModel("models/gemini-2.5-flash")
```

Activity 2.2: Main Functionality – Leaf Analysis Routing

Image Upload Interface

```
st.title("🌿 Leaf Health Check")

uploaded_file = st.file_uploader(
    "Upload a plant leaf image",
    type=["jpg", "png", "jpeg"]
)
```

Image Processing

```
if uploaded_file:
    image = Image.open(uploaded_file)
    st.image(image, caption="Uploaded Leaf", use_column_width=True)
```

Gemini AI Diagnosis Request

```
prompt = """
Analyze the uploaded plant leaf image.

Tasks:
1. Identify plant species.
2. Detect discoloration (yellow/brown areas).
3. Predict possible disease.
4. Assign severity level (Healthy, Mild, Moderate, Severe, Dying).
5. Provide 3 recommendation tips.
"""

response = model.generate_content(prompt)
result = response.text
```

Display Result

```
st.subheader("Diagnosis Report")
st.write(result)
```

Activity 2.3: Severity Grading Logic

```
def calculate_severity(discolor_percent):  
    if discolor_percent <= 10:  
        return "Healthy"  
    elif discolor_percent <= 30:  
        return "Mild"  
    elif discolor_percent <= 60:  
        return "Moderate"  
    elif discolor_percent <= 80:  
        return "Severe"  
    else:  
        return "Dying"
```

Activity 2.4: Export Functionality

Generate Text Report

```
def generate_report(content):  
    filename = "outputs/leaf_report.txt"  
    with open(filename, "w") as f:  
        f.write(content)  
    return filename  
  
python  
  
if st.button("Download Report"):  
    file = generate_report(result)  
    st.download_button("Download", open(file))
```

Activity 2.5: Utility Functions

Clean AI Response

```
def clean_response(text):  
    return text.strip()
```

Unique File Generator

```
from datetime import datetime  
  
def generate_filename():  
    return datetime.now().strftime("%Y%m%d_%H%M%S")
```

MILESTONE 3: Backend – Streamlit Integration (app.py)

This milestone focuses on implementing the complete backend logic inside the Streamlit application, integrating the Google Gemini AI Studio API, handling image processing, performing diagnosis generation, and enabling export functionality. The system ensures proper validation, structured responses, and smooth interaction between the UI and AI services.

Activity 3.1: Complete Function Definitions

All backend processing is implemented with:

- Input image validation
- Error handling mechanisms
- Gemini API response handling
- Logging and debugging support
- Structured diagnosis output formatting

Image Validation Example

```
def validate_image(file):  
    if file is None:  
        return False, "No image uploaded"  
    return True, "Valid image"
```

Activity 3.2: Modular Architecture

Main Application Structure

```
import streamlit as st
import google.generativeai as genai
import os
from dotenv import load_dotenv

load_dotenv()

genai.configure(api_key=os.getenv("GEMINI_API_KEY"))

model = genai.GenerativeModel("models/gemini-2.5-flash")

st.title("🌿 Leaf Health Check System")

print("="*60)
print("Leaf Health Check - Starting Application")
print("✓ Gemini API Key configured")
print("✓ Using model: gemini-2.5-flash")
print("="*60)
```

The Streamlit application directly manages:

- User interaction
- AI communication
- Diagnosis generation
- Result visualization

Activity 3.3: Gemini AI Diagnosis Integration

Generate Diagnosis from Image

```
def generate_diagnosis():
    prompt = """
    Analyze the uploaded plant leaf image and provide:
    1. Plant species
    2. Possible disease
    3. Discoloration analysis
    4. Severity level (Healthy, Mild, Moderate, Severe, Dying)
    5. Three rescue tips
    """

    response = model.generate_content(prompt)
    return response.text
```

Display AI Response

```
if st.button("Analyze Leaf"):
    result = generate_diagnosis()
    st.subheader("Diagnosis Result")
    st.write(result)
```

Activity 3.4: Export Implementation

Complete export functionality includes:

- Diagnosis report generation
- Downloadable text/PDF report
- File management and naming

Report Generation

```
def export_report(content):  
    filename = "leaf_health_report.txt"  
    with open(filename, "w") as f:  
        f.write(content)  
    return filename
```

python

```
st.download_button(  
    label="Download Report",  
    data=result,  
    file_name="leaf_health_report.txt"  
)
```

Activity 3.5: Error Handling and Response Formatting

```
def clean_response(text):  
    if text:  
        return text.strip()  
    return "No response generated"
```

MILESTONE 4: UI Development

This milestone focuses on designing and implementing a user-friendly and responsive interface for the Leaf Health Check application using the Streamlit framework. The UI ensures smooth interaction between the user and the AI system, enabling easy image upload, analysis execution, and result visualization.

Activity 4.1: Home Page Development

The home page acts as the primary interface for user interaction and provides clear guidance on how to use the application.

Home Page Features:

- Application title and description
- Leaf image upload section
- Supported image format information
- Analyze button for triggering diagnosis
- Clean and responsive layout

UI Design Considerations:

- Simple and minimal design
- Clear instructions for users
- Responsive layout across screen sizes
- Intuitive navigation flow

Activity 4.2: Leaf Analysis Page

This section handles user input and displays AI-generated results after analysis.

Features Implemented:

- Image preview after upload
- Loading spinner during analysis
- Gemini AI diagnosis display
- Plant species identification
- Disease detection result
- Severity grading badge

Severity Levels Displayed:

- Healthy
- Mild
- Moderate
- Severe
- Dying

Activity 4.3: Rescue Recommendation Display

After diagnosis, the system presents actionable rescue recommendations to help users treat the affected plant.

Rescue Tips Section Includes:

- Three personalized rescue tips
- Tips based on disease type and severity
- Easy-to-read bullet format
- Practical and actionable suggestions

Activity 4.4: Result Export Option

To enhance usability, the UI provides an option to download the diagnosis report.

Export Features:

- Download diagnosis as a text/PDF report
- Automatically generated report name
- Includes plant name, disease, severity, and tips

Activity 4.5: Error Handling and User Feedback

Proper feedback mechanisms are integrated to improve user experience.

Handled Scenarios:

- Invalid image format
- No image uploaded
- AI response failure
- Low-quality image warning

Feedback Methods:

- Warning messages
- Error alerts
- Success notifications

MILESTONE 5: Testing & Optimization

This milestone focuses on comprehensive testing, quality evaluation, and performance optimization of the Leaf Health Check application to ensure accuracy, reliability, and smooth user experience. Multiple test scenarios were executed to validate image analysis, AI diagnosis, severity grading, and rescue recommendations.

Activity 5.1: Comprehensive Testing

Test Scenarios

1. Leaf Image Analysis

- Input Type: Plant leaf images

- Formats Tested: JPG, PNG, JPEG
- Conditions: Healthy, diseased, partially damaged leaves
- Expected Output: Accurate diagnosis with severity grading and rescue tips

Test Cases Executed:

- Healthy green leaf image
- Yellowing leaf image
- Brown spot infected leaf
- Severely damaged leaf image
- Low-quality and blurred images

2. Discoloration Detection

- Colors Tested: Yellow, brown, black
- Severity Levels Verified: Healthy, Mild, Moderate, Severe, Dying
- Expected Result: Correct severity classification based on affected area

3. Gemini AI Diagnosis Testing

- API Used: Gemini AI Studio API Key
- Model Tested: Gemini Vision Model
- Expected Output:
 - o Plant species identification
 - o Disease prediction
 - o Confidence-based severity grading
 - o Three actionable rescue tips

4. Error Handling Scenarios

- No image uploaded
- Unsupported image format
- Corrupted image file
- API response delay or failure

Expected Behavior:

- User-friendly error messages
- Graceful failure handling
- No application crash

Activity 5.2: Quality Evaluation

The output quality of the system was evaluated using the following metrics:

- Diagnosis Accuracy
- Severity Classification Correctness
- Relevance of Rescue Tips
- Response Consistency
- User Interface Clarity
- Report Export Quality

Each test output was manually reviewed to ensure logical correctness and practical usefulness.

Activity 5.3: Performance Optimization

Improvements Made

- Faster image preprocessing using optimized resizing
- Reduced Gemini API response latency
- Improved input validation logic
- Optimized Streamlit layout rendering
- Added loading indicators for better user feedback
- Reduced unnecessary re-computation using session state

Activity 5.4: Final Validation

After optimization, the system was re-tested to confirm:

- Stable application performance
- Accurate AI predictions
- Correct severity grading
- Smooth UI interaction
- Successful report downloads

Conclusion

The Leaf Health Check project successfully demonstrates the application of AI-powered image analysis to assist in early plant disease detection and health assessment. By integrating the Streamlit framework with Google Gemini AI Studio, the system efficiently analyzes plant leaf images to identify possible diseases, detect discoloration patterns, determine severity levels, and provide actionable rescue recommendations.

The application processes user-uploaded leaf images in real time, leveraging Gemini's advanced vision and reasoning capabilities to generate accurate and meaningful diagnosis reports. The intuitive and responsive Streamlit interface ensures ease of use, allowing users to quickly upload images, view analysis results, and download reports without technical complexity. The system emphasizes reliability, usability, and performance through structured testing, optimization, and effective error handling.

Overall, Leaf Health Check serves as a smart digital assistant for farmers, gardeners, and agricultural enthusiasts by enabling timely plant health assessment and informed decision-making.

The project highlights the potential of AI-driven solutions in modern agriculture and lays a strong foundation for future enhancements such as multi-crop support, real-time camera integration, and advanced disease prediction models, contributing to sustainable and technology-driven farming practices.
